- Report to the Oregon Processed Vegetable Commission

2001-2002

1. Title:
2. Project Leaders:
3. Project Status:
4. Project Funding:

Green Bean Breeding
James R. Myers, Horticulture
Brian Yorgey, Food Science and Technology
Terminating 30 June, 2002
$\$ 61,635$ breeding
$\$ 10,113$ processing
\$ 71,748 total

Breeding funds were used for a major portion of the support of a vegetable breeding technician, student labor, supplies, and research farm expenses. Processing funds were used for processing samples of experimental beans, laboratory analysis, and for student labor.

## 5. Objectives:

i. Breed Bush Blue Lake green bean varieties with high economic yield and improved plant architecture.
ii. Improve pod characteristics including straightness, color, smoothness, texture, flavor and quality retention, and combine with delayed seed size development.
iii. Incorporate white mold resistance and improve root rot tolerance while maintaining resistance to bean common mosaic virus.
iv. Develop a molecular marker map to facilitate marker-assisted selection of desirable horticultural traits.
v. Evaluate novel genetic traits of potential benefit.

## 6. Report of Progress:

Bean breeding lines and commercial varieties were tested in replicated trials planted 25 April, 07 May, 14 June, and 02 July. The advanced trial planted 25 April consisted of four check varieties and six advanced lines planted in two-row plots replicated six times. The 07 May and 02 July trials were preliminary trials, and consisted of one row per entry replicated six times. These trials had five check varieties and 19 and 14 experimental lines, respectively. The 14 June trial consisted of five check varieties (two full sieve, and three small-sieve green beans), three OSU lines, and 16 commercial entries (all green beans except for two normal Romanos, and two wax Romanos). An additional six commercial bean entries ( 5 green bean and one Romano) were grown in the 02 July Trial.

For all trials, five-foot sections of row were handpicked on each harvest date in each of four replications. In most cases, three harvests on alternate days were made to obtain a range of maturity. Replications were combined for grading.

Eighty recombinant inbred lines (RILs) and their parents (Minuette and OSU 5630) were tested in a trial with two replicates planted 02 June. Because of the number of lines involved in the trial, five foot sections of row were harvested only once at full maturity.

Samples were canned and frozen at the Food Science and Technology Pilot Plant for evaluation by industry representatives in February. Processed quality data will be published in a separate report.

Data from replicated yield trials are summarized in Tables 1-12 and Figures 1-12. The RIL trial is summarized in tables 13 and 14, and figures $13-18$. Root rot and white mold disease nursery can be found in tables 15-18.

The growing season in general was mild with no major problems. There appeared to be an early split set in the first trial, and some entries in the second trial had a severe split set. The first and second trials had a significant incidence of white mold. The commercial and last trials were less concentrated, with longer maturation periods. The last trial had particularly lush growth; despite the heavy vines and lodging, little white mold was observed.

Advanced Standard Sieve OSU Lines: For full sieve advanced lines, OR 54, OSU 5635, and OSU 5643 generally had the highest T/A and \$/A values (see summary table below, Tables 1-6; Figures 1-4, 11). OR 91G generally had the lowest yields. OSU 5669 showed greatest similarity to OR 91G for field performance but generally had better \$/A value and greater T/A yields. OSU 5669 has significantly better pod color as well as straighter and smoother pods. OSU 5635 and OSU 5643 are most similar to OR 54 with straighter and smoother pods.

Season average \$/A based on:

| Line | Trial averages $^{2}$ | Selected harvests $^{\text {y }}$ | Highest harvests |
| :--- | :---: | :---: | :---: |
| Oregon 91G | 927 | 978 | 978 |
| Oregon 54 | 1057 | 1039 | 1150 |
| OSU 5635 | 1046 | 1042 | 1112 |
| OSU 5643 | 1010 | 946 | 1092 |
| OSU 5669 | 967 | 976 | 1027 |
| LSD @5\% | 81 | 121 | 73 |

${ }^{2}$ Average of 2-4 harvests from 3 trials, based on weight of graded beans.
${ }^{\text {y }}$ The harvest selected as best for comparison and used for analysis of variance at $50 \% 1-4$ sieve in tables 5 and 6.

Four year averages for yield and $\$ / \mathrm{A}$ values are shown below for full sieve advanced lines and checks. Trends in the data generally suggest the following order: $\mathrm{OR} 54=\mathrm{OSU}$ $5643>$ OSU $5669>$ OR 91 G. Also shown below are number and percent of trials in which advanced lines outperformed the checks, as well as yield advantage over the check
varieties. OSU 5669 had greater yields than OR 91 G in $70 \%$ of 23 trials conducted over the past five years and out yielded OR 91G on average by $104 \%$. OSU 5643 out yielded OR 91 G by $102 \%$ in $62 \%$ of 13 trials. Both OSU 5669 and OSU 5643 performed well against OR 54 with average yields equivalent to OR 54 , while outperforming the check in 48 and $39 \%$ of trials, respectively.

${ }^{2}$ Overall T/A of selected lines expressed as a percent T/A of 91 G .
Two and a quarter acres of OSU 5669 was grown in one commercial field in 2001. It yielded $7.5 \mathrm{~T} / \mathrm{A}$ at $69 \%$ 1-4 sieve pods. Field reports indicate that the plant habit was better than OR 91 G . It was also more efficient in running through the processing plant.

${ }^{2}$ Overall T/A of selected lines expressed as a percent T/A of OR 54.
In terms of pod quality, OSU 5643 has better color than OR 91 G and similar to OR 54. OSU 5643 was rated as having significantly straighter and smoother pods than most other advanced lines or checks. It also had pods of similar length to OR 54, and slightly longer than other advanced lines and OR 91G. OSU 5669 had significantly better pod color in most trials compared to checks and other advanced lines. In the first and last trials though, pod color was not as significantly different. It may be that the pod color of OSU 5669 may be more responsive to environmental effects (temperature, light intensity) than other BBL varieties. Pod length of OSU 5669 was shorter than OR 91G (approximately 14 vs. 15 cm ), which contributes to pod straightness. Pod straightness and smoothness were much better than OR 91G and OR 54. OSU 5643 (a sister line to OSU 5635) is from the cross OR 54 X OSU 5163. Growth habit of OSU 5643 in the field is similar to OR 54. OSU 5643 is about a day earlier in maturity than OR 54. Overall, OSU 5643 appears to be better than OSU 5635 , and is suitable as a replacement for OR 54. It does appear to be more concentrated in set than does OR 54. OSU 5669 is from the cross OSU 5256 X OR 54 . It is similar in maturity to OR 91 G , and is recommended as a replacement for that cultivar.

Other standard sieve lines: Two preliminary trials were grown this year with six standard sieve lines included in addition to the advanced lines (Tables $2 \& 3$; Figures $2 \& 3$ ). OSU 5618 , OSU 5699, OSU 5706 and OSU 5793 were repeats from last year's trials. New this year were OSU 5974 and OSU 5996. OSU 5706 (OSU 5256 X OSU 5416) had T/A and $\$ /$ A values that were comparable to, or greater than OR 54, and has very good pod quality. OSU 5618 , from the cross OR 54 X OR 91 G , had good pod color and high quality bush blue lake pods, but yielded about the same as OR 91G. It may be best used as an intermediate ( $60 \%$ ) sieve size bean. Among the lines new to the trials, OSU 5974 was only tested in the 7 May planting, where it had the lowest yield among full sieve beans. It also has very oval pods, and should be dropped from the program. Perhaps the most interesting of the new full sieve beans is OSU 5996. It is a persistent chlorophyll ( $p c$ ) type with mature green seeds and foliage that remains green after senescence from the cross OR 54 x Hypak. Pods are of excellent quality and extremely dark green in color. It has a very erect plant habit with pods generally set high on the plant. Yields were similar to OR 91 G in the 7 May trial, but were significantly less in the 2 July trial.

Notes indicate that lower yields in the second trial may have been influenced by a split set. Like other $p c$ varieties, this line exhibits lower germination and emergence than normal seeded lines, and requires a fungicide seed treatment for normal stand establishment. Assuming that no major flaws are found, this line represents a quantum leap forward for improving BBL pod quality.

Small Sieve Beans: (Tables 7-10, Figures 5-8, 12). OSU 5613, Minuette, and Medinah were used as checks for comparison to small sieve beans. Minuette produces a majority of three and four sieve beans while OSU 5613 and Medinah produce three sieve as the largest class. In advanced trials, OSU 5819 , OSU 5835 , and OSU 5844 were again tested. Of these, OSU 5835 has the greatest potential although it tended to heart- or ovalpod cross section in some trials. OSU 5844 had a strong oval shape and should be dropped from the program. OSU 5819 has round pod cross section and darker green color compared to OR 91 G , but yields were similar to or less than Minuette, and pod size distribution was quite broad indicating a possible mix in this line.

Season Average \$/A based on

| Line | Trial Averages $^{2}$ | Selected Harvests $^{\mathbf{y}}$ | Highest Harvests |
| :--- | :---: | :---: | :---: |
| OSU 5613 | 699 | 709 | 801 |
| OSU 5819 | 850 | 893 | 962 |
| OSU 5835 | 955 | 977 | 993 |
| Minuette | 845 | 837 | 819 |
| LSD @5\% | 136 | 99 | NS |

${ }^{2}$ Average of 2-5 harvests from 3 trials, based on weight of graded beans.
${ }^{y}$ The harvest selected as best for comparison and used for analysis of variance in table 10.

Two year yield averages (see table below) indicate that both OSU 5819 and OSU 5835 have better yield potential than either Minuette or OSU 5613. Both lines should be continued for another year of testing.

Two year average for small sieve beans ${ }^{2}$

|  | T/A |  |  | \$/A |  |  |

| Average of 2 and 3 trials in 2000 and 2001 respectively. Yields are field yields. |  |  |  |  |  |  |

Other small sieve beans retested in preliminary trials included OSU 5800, OSU 5870, OSU 5912, OSU 5944, and OSU 5947. Small sieve beans tested for the first time this year included OSU 5852, OSU 5855, and OSU 5879. Because of strongly oval pods, OSU 5855, OSU 5870, and OSU 5947 should be dropped from the program. OSU 5800
had very high \$/A value, followed by OSU 5852. Both show potential for an intermediate sieve class, and should be tested again next year. OSU 5944 was similar to OSU 5613 in yield, but possesses better pod quality. It did show some variation for pod shape between trials, but may be a suitable replacement for OSU 5613 if there is demand for three sieve bean varieties. It should also be tested again.
Commercial Bean Trial: Varieties supplied by private breeders were grown in two trials: the main commercial trial planted on 14 June, and the Pureline Seeds (PLS) entries included in the 02 July trial (Tables 3, 5, 6, $9-12$, Figures 3, 7, 9, 10). Comparisons should be made to the check varieties in each trial, and not to between trials. Two lines that are very close to the BBL type, and were tested in 2000 were again included (SB 4247, and SB 4249). SB 4247 again showed good plant architecture, and both SB lines had yields similar to OR 91G. The KSI lines, while not of BBL type, appeared to be of good quality with smooth, straight pods. The full sieve lines had yields similar to OR 91G while the small sieve lines had lower yields. Perhaps best of the set is KSI 196. Highest yielding among the small sieve types was SB 4087 with yields rivaling OR 54 and OSU 5643. Color was similar to OR 91G. EX 08190504 was notable for its very slow seed development. Even at its final harvest at 19\% 1-4 sieve, it showed only moderate seed development in very smooth pods. Among PLS entries Igloo again had high \$/A. Among Romano types, EX 08790500 and EX 08190506 were highest yielding. While interesting as a small sieve Romano type, R 6004 had relatively low yields set on a rather floppy bush. PLS 118 Romano had yields similar to OR 91G.
Recombinant Inbred Trial: A recombinant inbred (RI) population based on the cross Minuette x OSU 5630 and its reciprocal was evaluated for morphological and horticultural traits (plant height, internode length, branching, leaf color, leaf size, pod color, pod straightness, pod distribution, pod clustering, crop load, lodging, stem thickness, hybrid weakness factor ( $D t$ ) and shiny vs. dull pods (ace) again this year. In addition, 80 RILs were included with parents in a processing trial (Tables 13 and 14, Figures 13-18). This population is being used to elucidate the genetic control of processing traits in green beans. Percent 1-4 sieve pod distribution was bimodal, with a higher peak at $90-99 \%$ 1-4 sieve (Figure 13). Such a pattern would suggest that small sieve size is dominant over large sieve size, and that the trait is controlled by relatively few genes. Color scores were fairly widely distributed, but showed a roughly unimodal distribution, suggestive of additive gene action where many genes with strong environmental effects were involved (Figure 14). Pod length exhibited a normal distribution that was skewed towards shorter pod length (Figure 15). Such a distribution would suggest that short pod length is dominant to long pods and that the trait is controlled by several to many genes. Pod straightness showed a similar distribution (Figure 16) and may in fact be correlated with pod length. Pod smoothness also showed a normal distribution with skewing towards smoothness (Figure 17). Pod width and height are plotted together to give a representation of pod cross section shape (Figure 18). The dashed line indicates equal length and height as would be expected for pods with round cross section. Pods to the left of the line are oval, those to the right of the line are creaseback in cross section. The scatter of points is suggestive of a normal distribution, but skewed towards crease-back cross sectional shape. In addition, data were collected on
presence of pod suture strings, and pod shininess. Shiny vs. dull pods segregated in a 1:1 ratio as would be expected for a single gene. Lines with pod suture strings were low in number and did not fit any expected segregation ratio. It is of interest that this cross segregates for pod strings and pod cross sectional shape because both parents are stringless and have round pods. This suggests that different gene complexes within the two lines control similar pod quality traits. Some of our recent research into snap bean phylogeny has demonstrated that the Oregon BBL materials belong to the Mesoamerican center of domestication whereas Minuette arises from the Andean center of domestication. Each possesses a distinctive set of alleles for the 53 molecular makers with which we have tested this material. During the winter of 2001-2002, we will be integrating morphological and molecular marker data, as well as adding additional molecular markers, to create a genetic map for snap bean.

Root rot and white mold trials: A root rot trial containing 68 checks and breeding lines was grown in two replicates and evaluated (Table 15). Disease severity was relatively high. Most OSU lines were moderately to highly susceptible. Only the later maturing entries had relative low scores apart from the check lines.
One hundred checks, breeding lines and germplasm accessions were grown in a white mold nursery (Table 16). Disease incidence was greater than last year and about the same as in 1999. Among OSU breeding lines OSU 5958 and OSU 5978 are of interest because of low scores. Both lines are fairly upright with porous canopies, suggesting that architecture may play a role in low white mold incidence. Many of the "B" lines had relatively low scores, and may have physiological resistance. B7354-6-2-1 continues to exhibit considerable resistance, and has done well in the straw tests. Segregating populations crossed to this line and others are being advanced and tested with the straw test. Correlation among white mold incidence, estimated yield, and growth habit (Table 17) showed a significant correlation between white mold score and growth habit (white mold incidence decreased with increasing erectness). White mold field ratings over the past four years is shown in Table 18.
Development and evaluation of new materials: Selection continues in the Oregon blue lake X Minuette crosses to obtain lines with improved architecture. Many selections from these crosses also have extremely dark green pods. This material was harvested as small bulks, so seed will be available for testing in replicated trials next year. Other crosses have been made, and populations are being advanced for white mold resistance, additional sources of improved architecture and general population improvement within the blue lake background.

## 7. Summary:

Nineteen OSU lines were evaluated in replicated handpicked yield trials planted over the period 25 April to 02 July. OR 91 G and OR 54 were included as full sieve checks, and Minuette, Medinah, and OSU 5613 were included as a small sieve checks. Twenty-two commercial varieties (including standard and small sieve green beans, and Romano beans) were also evaluated. OSU 5669 is a line with yields similar to or better than OR 91 G , and with superior pod quality. This line should be strongly considered for release
this winter. A promising line for release to replace OR 54 is OSU 5643. Another line of great interest is OSU 5996 with its excellent pod quality and color. Among small sieve lines, several look good, but there are no stand outs. OSU 5819, OSU 5835, and OSU 5944 should be retested next year. A processing trial of a Minuette x OSU 5630 recombinant inbred population revealed new data on the genetic control of processing traits. When combined with molecular marker data from this population, we should be able to map and further characterize genetic control of snap bean processing traits. White mold and root rot trials were continued with the identification of several lines with resistance. Crosses with new white mold resistant lines were made, and populations were advanced in the field.

${ }^{2}$ Percent calculated as \% of total of 1-6 sieve beans.
${ }^{\text {y }}$ Total weight of graded beans, including sieve sizes 1-6. Values will be lower than those reported in Table 10 because some beans are lost in the grading process. Analysis of variance (Table 10) was calculated using the harvest marked with *.
${ }^{\mathrm{x}} \$ /$ acre based on $\$ 110 /$ ton (1-4 sieve); $\$ 43 /$ ton ( $5-6$ sieve) for intermediate sieve beans ( $5819,5835,5800,5852$, Minuette, Igloo, PLS 86), and $\$ 87 /$ ton ( $1-4$ sieve); $\$ 0 /$ ton ( $5-6$ sieve) for small sieve beans ( 5613,5944 , Medinah, PLS 87).

Table 10. Statistical comparison of yields and dollar return of small sieve OSU green bean lines and commercial lines, Corvallis, 2001. ${ }^{\text { }}$

${ }^{2}$ Based on one selected harvest for each variety in each trial, which was the middle harvest, unless sieve size distribution or notes indicated the variety was overmature (marked with * on Tables 7, 8, 9 \& 11). Yields are field yields of 1-6 sieve beans.

${ }^{2}$ Percent calculated as \% of total of 1-6 sieve beans.
${ }^{y}$ Total weight of the graded beans, including sieve sizes 1-6. Values will be lower than those reported in Table 12 because some beans are lost in the grading process.
${ }^{\times} \$ /$ acre based on $\$ 119 /$ ton for $1-4$ sieve and $\$ 44 /$ ton for $5-6$ sieve for full sieve and $4-5$ sieve beans; $\$ 110 /$ ton for $1-4$ sieve and $\$ 43 /$ ton for $5-6$ sieve for 4 sieve and $3-$ 4 sieve beans; and $\$ 87 /$ ton for $1-4$ sieve and $\$ 0 /$ ton for $5-6$ sieve for small sieve beans.

${ }^{\text {z Based }}$ on one selected harvest for each variety (marked with * on Table 11), which was the harvest closest to optimal based on that variety's intended use ( $50 \%$ 1-4 sieve for full sieve). Yields are field yields of 1-6 sieve beans.
${ }^{y}$ Full sieve beans were adjusted to $50 \%$ 1-4 sieve; all others were unadjusted.

${ }^{\mathbf{2}}$ Mean of 2 replications; subplots of 5 ' were harvested from single $20^{\prime}$ plots in rows 36 " apart.
${ }^{\gamma}$ Percent calculated as \% of total of 1-6 sieve beans.

Table 14. Notes on recombinant inbred lines, June 1 planting, Corvallis, 2001.

| Line | Color ${ }^{2}$ | Length (cm) | Width $(\mathrm{mm})^{y}$ | Height (mm) | Straightness ${ }^{x}$ | Smoothness ${ }^{\mathrm{x}}$ | Shiny or dull | Strings | Notes ${ }^{\text {w }}$ |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| R13-1 | 6 | 14 | 9.5 | 10 | 7 | 7 | shiny | yes | Seedy 6 sv, 4 \& 5 sv becoming seedy; high fiber; dark green; oval. |
| R13-2 | 5 | 11.5 | 10 | 10 | 5 | 3 | dull | part | Med. color 4 sv with mod positive curve. Bumpy with round seed. Seedy $4 \& 5$ sv. 3 sv ok. |
| R13-3 | 5 | 16 | 10 | 9.5 | 1 | 5 | dull | no | Tobacco streak virus symptoms on pods. Long curved pods. Light colored. Seedy 5 and 6, 4 is okay. |
| R13-4 | 6 | 14 | 10 | 12 | 7 | 7 | dull | no | Oval full sieve with color similar to 5630 ; BBL type pod. Seedy 5 \& 6 sv. |
| R13-5 | 8 | 12 | 11 | 8.5 | 9 | 5 | shiny | no | Very similar to Minuette but darker green color. Seedy 4 and 5 sieve, 3 sieve okay. |
| R13-6 | 3 | 12 | 10 | 9.5 | 7 | 7 | shiny | yes | Light colored 3 sv bean; has characteristic curve of stringy types. 3 sv ok but $4 \& 5$ sv seedy. |
| R13-7 | 8 | 13 | 8.5 | 9 | 9 | 5 | shiny | no | Very dark 4 sv bean with possible larger later sieve mix (genetic mix because same color \& similar in pod characteristics). Seedy 4 \& 5 sv . |
| R13-8 | 5 | 17 | 13 | 11 | 5 | 5 | shiny | no | Large crease-back pods. Variable color. Seedy 5 and 6,4 sieve okay. |
| R13-10 | 3 | 12 | 9.5 | 9.5 | 7 | 5 | dull | no | Small light colored 3 sieve. Seedy 4, 3 sieve okay. |
| R13-11 | 7 | 13 | 8 | 9 | 8 | 9 | shiny | no | Dark green oval, relatively long podded bean. Seedy $6 \mathbf{s v}$, but $4 \& 5$ sieve only becoming seedy. |
| R13-12 | 9 | 15 | 9.5 | 10 | 3 | 7 | dull | no | Long oval; extreme dark green; very uniform color; seedy $4,5,6 \mathrm{sv}$. Use in crosses. |
| R13-13 | 3 | 11.5 | 8.5 | 9 | 9 | 9 | dull | yes | Tends towards heart-shaped/oval in smaller sieves. Seedy 4 sv; very straight and smooth but light color. |
| R13-14 | 6 | 11 | 9 | 9.5 | 7 | 3 | dull | no | Short 3 to 4 sieve bean with good color; fairly straight. Seedy 5 \& 6 sv., 4 sv becoming seedy. |
| R13-15 | 3 | 14 | 9.5 | 9.5 | 7 | 9 | shiny | part | Very light colored shiny bean with relatively long slender pods. Seedy $6 \mathrm{sv}, 5 \mathrm{sv}$ becoming seedy. |
| R13-16 | 6 | 13.5 | 10 | 9 | 8 | 7 | dull | no | Seedy in 5 sieve, some 4 sieve becoming seedy. Long straight been with bbl color. |
| R13-17 | 3 | 13 | 9.5 | 9.5 | 5 | 7 | shiny | no | Long 5 sieve bean, but too light in color. Seedy in 4,5 \& 6 sv. |
| R13-18 | 5 | 15 | 10 | 9 | 3 | 5 | dull | yes | Long slender; light color; heart-shaped pod; seedy in 4,5, 6 sv. |

Table 14. Notes on recombinant inbred lines, June 1 planting, Corvallis, 2001 (cont).

| Line | Color ${ }^{2}$ | Length (cm) | Width $(\mathrm{mm})^{\gamma}$ | Height $(\mathrm{mm})^{\mathrm{y}}$ | Straightness ${ }^{x}$ | Smoothness ${ }^{x}$ | Shiny or dull | Strings | Notes ${ }^{\text {w }}$ |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| R13-19 | 7 | 14.5 | 11.5 | 11 | 7 | 5 | shiny | no | Fairly pronounced two-tone color; 5 sv bean. Seedy 6 sv, 5 sv ok. |
| R13-20 | 6 | 13 | 12 | 10 | 9 | 5 | dull | no | Good color; short. Seedy 5 \& $6 \mathrm{sv}, 4$ sv ok. |
| R13-21 | 6 | 13.5 | 13 | 11.5 | 8 | 7 | shiny | no | Short dark green bean with RC; seedy 6 sv but 5 sv ok. |
| R13-22 | 5 | 12 | 9.5 | 10 | 5 | 9 | dull | part | Long; slender; light-colored; high fiber. Seedy $4 \& 5 \mathrm{sv}, 3$ sv not seedy. |
| R13-23 | 7 | 17 | 12 | 10 | 1 | 1 | shiny | no | A dark green, creaseback, curvy and bumpy bean. Moderate seed development in 45 \& 6 sieve. |
| R13-24 | 1 | 13.5 | 9 | 9 | 7 | 3 | dull | yes | Light color with RC. Seedy in 4 \& 5 sv . |
| R13-25 | 6 | 12 | 9 | 10 | 7 | 5 | dull | yes | Seedy 3 and 4 sv. Nearly all pods curved, oval. Good color. |
| R13-26 | 9 | 11 | 10.5 | 10 | 8 | 7 | shiny | no | Short; extreme dark green; crease back; full sieve; seedy 6 sv, moderately seedy 5 sv. |
| R13-27 | 9 | 11.5 | 12 | 10 | 9 | 5 | shiny | no | Very dark green; short. Seedy 6, moderate seed development in 4 and 5. |
| R13-28 | 3 | 13.5 | 7.5 | 9 | 3 | 7 | shiny | part | Long 4 sv , relatively light color. Oval \& seems to be one of the high fiber types. Seedy $4 \& 5 \mathrm{sv}, 3 \mathrm{sv}$. ok. |
| R13-29 | 6 | 13.5 | 8.5 | 9 | 5 | 9 | dull | no | Except for curve, a nice looking bean; dark green; a bit oval. Seedy \& pithy $6 \mathrm{sv}, 5 \mathrm{sv}$ seedy, 4 sieve becoming seedy. |
| R13-30 | 8 | 12 | 8.5 | 9 | 9 | 5 | dull | yes | Oval; high fiber. Seedy 4 and 5, 3 sieve okay. |
| R13-31 | 5 | 15 | 9.5 | 10 | 7 | 3 | shiny | part | Long, skinny, light colored. Seedy 6 sieve, moderate seed development in 4 and 5. |
| R13-32 | 6 | 12.5 | 11 | 9.5 | 5 | 7 | dull | no | Short med. colored bean. Seedy 6 sv. 5 \& 4 sv ok. |
| R13-33 | 5 | 11.5 | 9.5 | 9.5 | 9 | 7 | dull | yes | Short straight 4 sv bean, seedy 5 sv , some 4 sv seedy. |
| R13-34 | 9 | 13.5 | 11 | 10.5 | 7 | 5 | shiny | no | Extreme dark green $4-5$ sv bean; somewhat bumpy. Seedy 5 \& $6 \mathrm{sv}, 4 \mathrm{sv}$ mix of seedy and non-seedy pods. |
| R13-35 | 5 | 11.5 | 8.5 | 9 | 7 | 7 | shiny | no | Relatively short-podded 4 sv bean, color good; RC in 5 sv beans. 5 sv very seedy, 4 sv seedy and 3 sv developing seeds. |
| R13-36 | 5 | 14 | 7 | 9 | 9 | 9 | dull | yes | Very oval; highly variable color; high fiber; 5\&6 sv very seedy, others not at all--two different beans? (though similar in other respects except color). |

Table 14. Notes on recombinant inbred lines, June 1 planting, Corvallis, 2001 (cont).

| Line | Color ${ }^{2}$ | Length (cm) | Width $(\mathrm{mm})^{y}$ | $\begin{aligned} & \text { Height } \\ & (\mathrm{mm})^{y} \end{aligned}$ | Straightness ${ }^{\mathrm{x}}$ | Smoothness ${ }^{x}$ | $\begin{gathered} \text { Shiny or } \\ \text { dull } \end{gathered}$ | Strings | Notes ${ }^{\text {w }}$ |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| R13-37 | 6 | 14.5 | 8.5 | 9.5 | 3 | 9 | dull | yes | Flat podded; high fiber; seedy 4 \& 5, some 2 \& 3 seedy; grading not accurate because of flatness. |
| R13-38 | 5 | 14 | 8.5 | 9 | 9 | 8 | dull | yes | Very straight, long 4 sieve bean, but mediocre color. Seedy $5 \mathrm{sv}, 4$ sv only moderately seedy. |
| R13-39 | 9 | 10.5 | 11 | 9.5 | 5 | 5 | shiny | part | An extreme dark green, short bean. Seedy in 5 \& 6 sv. although some 6 sv are not seedy suggesting a mix. Strong RC. |
| R13-41 | 1 | 12 | 10 | 9 | 5 | 5 | dull | no | Very light color; short pods with strong RC. Seedy 4 \& 5 sv. |
| R13-42 | 7 | 12.5 | 10 | 10.5 | 7 | 7 | shiny | no | Short slightly oval dark green bean with strong RC. Seedy in $5 \& 6 \mathrm{sv}, 4$ sv becoming seedy. |
| R13-43 | 9 | 20 | 12 | 12 | 3 | 5 | dull | no | Very long (even in 4 sieve it's 17 cm ). Extremely dark green, but 2 tone color. 6 sieve seedy, some 5 sieve not seedy. Much battering in grader. |
| R13-44 | 7 | 12.5 | 9.5 | 10 | 9 | 9 | shiny | no | Dark green color; short; slight oval pods; very straight and smooth. Seedy 3 \& 4 sv. |
| R13-45 | 7 | 11.5 | 10.5 | 11 | 7 | 7 | shiny | no | Short dark green Minuette-like pods. 5 and 6 seedy, 4 sieve becoming seedy. |
| R13-46 | 8 | 12.5 | 8.5 | 9.5 | 5 | 7 | shiny | yes | Dark green; oval with moderate RC. Seedy 4 \& 5 sv. |
| R13-47 | 6 | 12.5 | 11 | 9 | 7 | 5 | shiny | no | Med length; fairly good color; mod seed dev in 5 \& 6 sv, |
| R13-48 | 7 | 13.5 | 9 | 9.5 | 9 | 7 | shiny | yes | Highly variable color; slight. oval. Seedy 4 \& 5 sv. |
| R13-49 | 7 | 16 | 11.5 | 10 | 5 | 1 | shiny | no | Very dark green full sieve bean; somewhat curved. Seedy 6 sv, but 5 sv only beginning to develop seeds. |
| R13-51 | 7 | 16 | 13.5 | 11.5 | 5 | 3 | dull | no | Large but short pods; dark green color. Moderately seedy 5 and 6,4 sieve not seedy. Lots of variability for pod length and other pod traits. |
| R13-52 | 7 | 12.5 | 10.5 | 9 | 8 | 7 | no | no | Med length; dark green; nice looking. Test in yield trial? Seedy in 5 sv , mod seedy in $3 \& 4 \mathrm{sv}$. |
| R13-53 | 5 | 11 | 9 | 9 | 9 | 5 | shiny | no | Average color but highly variable two-tone pods. 3 sv bean that becomes bumpy easily. Seedy 5 sv . mix of seedy and non in 4 sv . 3 sv showing some seed development. |

Table 14. Notes on recombinant inbred lines, June 1 planting, Corvallis, 2001 (cont).

| Line | Color ${ }^{2}$ | Length (cm) | Width (mm) ${ }^{y}$ | Height (mm) ${ }^{\mathrm{y}}$ | Straightness ${ }^{\text {x }}$ | Smoothness ${ }^{x}$ | Shiny or dull | Strings | Notes ${ }^{\text {w }}$ |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| R13-54 | 5 | 14 | 9 | 11.5 | 3 | 5 | dull | no | Oval; medium long; med. green. Seems to be a mix of sizes, ovals and round, and maturities. Seedy in 5 \& 6 sv. 4 sv becoming seedy. |
| R13-55 | 7 | 14 | 8.5 | 9 | 9 | 3 | shiny | yes | Seedy 5 \& 6 sv , becoming seedy in 3 sv ; shiny dark green; oval; not seedy; round when seedy. |
| R13-56 | 7 | 13 | 9.5 | 10 | 7 | 9 | dull | yes | Dark green; slight oval; seedy 4 \& 5, 4 sv OK. |
| R13-57 | 6 | 13 | 11.5 | 10 | 7 | 7 | dull | no | Med length pod; dark green; seedy in $5 \& 6$, mod seedy in 4 sv. |
| R13-59 | 8 | 14.5 | 10.5 | 9 | 7 | 7 | shiny | no | Nice full sieve bean with dark green to extreme dark green pods (variable, two-tone appearance). Seedy $6 \mathrm{sv}, 5 \mathrm{sv}$ becoming seedy. |
| R13-60 | 5 | 14 | 9.5 | 9 | 9 | 5 | shiny | yes | Long med green 4 sv; very bumpy and very two-tone color. $V$. seedy 6 sv , seedy $4 \& 5 \mathrm{sv}$. |
| R13-61 | 7 | 13 | 11.5 | 9.5 | 5 | 7 | yes | part | Short; dark green; creaseback; high fiber. Seedy \& pithy 6 sv, 5 sv seedy, 4 sv becoming seedy. |
| R13-62 | 5 | 10 | 9.5 | 9 | 9 | 7 | dull | no | Yellow-green 4 sv bean; very straight. Seedy 5 sv, $3 \& 4$ sv moderately seedy. |
| R13-63 | 3 | 14 | 10 | 10 | 7 | 3 | shiny | part | Long; slender; very light color. Seedy 5 \& 6 sv, 4 sv ok. Bad IC. |
| R13-64 | 5 | 11.5 | 9 | 8.5 | 3 | 7 | dull | no | High degree of curving comes from many pods with almost 180 degree RC. Seedy 4 \& 5 sv. |
| R13-65 | 8 | 17 | 12.5 | 9.5 | 5 | 7 | shiny | no | Large; dark green but two tone; seedy 6 sv \& some pithy, 4 \& 5 sv not seedy. |
| R13-66 | 5 | 11 | 10 | 10 | 9 | 9 | dull | part | Small short pods with good color. Seedy 4 sv, some 3 sv seedy. |
| R13-67 | 5 | 11 | 9 | 8.5 | 7 | 3 | dull | no | Short med colored bean. Seedy 4, 5 \& 6 sv . |
| R13-68 | 6 | 12 | 9 | 8.5 | 8 | 5 | shiny | part | Nice 3 sv bean; good color; slight positive curve. Seedy 4 and 5 sv , some 3 sv seedy. |
| R13-69 | 6 | 15 | 10 | 9 | 7 | 5 | shiny | yes | Mix with a few full sieve plants. Fairly long, slender, oval 4 sieve bean. Seedy in $3,4 \& 5 \mathrm{sv}$. |
| R13-70 | 9 | 13 | 9 | 9 | 7 | 9 | shiny | yes | Extreme green but shows two tone variability. 3 sv bean. Seedy 5 sv, 4 sv ok. |

Table 14. Notes on recombinant Inbred IInes, June 1 planting, Corvallis, 2001 (cont).

| Line | Color ${ }^{2}$ | Length (cm) | Width (mm) ${ }^{y}$ | Height $(\mathrm{mm})^{\mathrm{y}}$ | Straightness ${ }^{*}$ | Smoothness ${ }^{x}$ | Shiny or dull | Strings | Notes ${ }^{*}$ |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| R13-71 | 3 | 10 | 7 | 9 | 7 | 7 | dull | no | Light colored 3 to 4 sieve. All pods slight positive curve. Seedy 4, mix of seedy and non seedy 3 pods. |
| R13-72 | 7 | 15 | 11.5 | 11.5 | 1 | 5 | dull | no | Dark green crooked pod; seedy 5 and 6, 4 sv becoming seedy. |
| R13-73 | 9 | 11.5 | 11 | 9.5 | 9 | 5 | shiny | yes | Very nice looking 4 sieve type - has very uniform dark green color. Seedy $5 \mathrm{sv}, 4 \mathrm{sv}$ becoming seedy. |
| R13-74 | 5 | 14 | 9 | 9.5 | 7 | 7 | dull | part | Oval 3 sv. Color ok; probably high fiber. Seedy $4 \& 5$ sv, 3 sv ok. |
| R13-75 | 7 | 14.5 | 11 | 9 | 7 | 3 | shiny | no | Seedy in 5 and 6 sv but not overly so. Nice line except for smoothness. |
| R13-77 | 7 | 13 | 11.5 | 10 | 8 | 7 | dull | no | Seedy 4,5 and 6 sv , short dark green pods with some RC. Many two-tone pods. |
| R13-78 | 7 | 11 | 9 | 8.5 | 9 | 5 | shiny | no | Very dark green $3-4$ sv. Seedy in $4 \& 5 \mathrm{sv}, 3$ sv has some seedy pods. |
| R13-79 | 9 | 11 | 12 | 9 | 5 | 5 | dull | no | Extremely short podded; creaseback; full sieve. Extreme dark green with BBL color. Pods somewhat two-tone with light color next to suture. Seedy 6 sv , but $4 \& 5$ sieve only developing seediness. |
| R13-80 | 5 | 15 | 10.5 | 9.5 | 5 | 7 | shiny | no | Long 4 sieve. Seedy 4 and 5, some seed development in 3 sieve. |
| 5630 | 6 | 15 | 11 | 10 | 5 | 7 | dull | no | Long; dark green color; typical BBL; relatively straight and smooth. Seedy 5 \& $6 \mathrm{sv}, 4 \mathrm{sv}$ starting to develop seeds. |
| Minuette | 5 | 13 | 9.5 | 8.5 | 9 | 7 | shiny | part | Short straight 4 sieve bean. Seedy 4 \& 5 sv . 3 sv ok. |

${ }^{2}$ Scores based on a 1-9 scale with 9 darkest.
yPod height and width measured on a cross-section with height measured from suture to suture and width measured perpendicular to height.
${ }^{\times}$Scores based on a 1-9 scale with 9 best.
