## 2017 WEATHER REPORT

Erik B. G. Feibert and Clinton C. Shock, Malheur Experiment Station, Oregon State University, Ontario, OR

## Introduction

Air temperature and precipitation have been recorded daily at the Malheur Experiment Station since July 20, 1942. Installation of additional equipment in 1948 allowed for evaporation and wind measurements. A soil thermometer at 4-inch depth was added in 1967. Since 1962, the Malheur Experiment Station has participated in the National Cooperative Weather Station system of the National Weather Service. The daily readings from the station are reported to the National Weather Service forecast office in Boise, Idaho.
A biophenometer to monitor degree-days and pyranometers to monitor total solar and photosynthetically active radiation were added in 1985. Starting in June 1997, the daily weather data and the monthly weather summaries have been posted on the Malheur Experiment Station web site at www.cropinfo.net.
On June 1, 1992, in cooperation with the U.S. Department of the Interior, Bureau of Reclamation, a fully automated weather station, linked by satellite to the Northwest Cooperative Agricultural Weather Network (AgriMet) computer in Boise, Idaho, began transmitting data from Malheur Experiment Station. The automated AgriMet station continually monitors air temperature, relative humidity, dew point temperature, precipitation, wind run, wind speed, wind direction, solar radiation, and soil temperature at 8 -inch and 20 -inch depths. Data are transmitted via satellite to a computer in Boise every 4 hours and are used to calculate daily Malheur County crop water-use estimates. The AgriMet database can be accessed at www.usbr.gov/pn/agrimet and from links on the Malheur Experiment Station web page at www.cropinfo.net.

## Materials and Methods

The ground under and around the weather stations was bare until October 17, 1997, when it was covered with turf grass. The grass is irrigated by subsurface drip irrigation. The manually observed weather data are recorded each day at 8:00 a.m. Consequently, the data in the tables of daily observations refer to the previous 24 hours.
Evaporation is measured from April through October as inches of water evaporated from a standard class A pan (10 inches deep by 4-ft diameter) over 24 hours. Crop evapotranspiration $\left(\mathrm{ET}_{\mathrm{c}}\right)$ for each crop is calculated by the AgriMet computer using data from the AgriMet weather station and the Kimberly-Penman equation (Wright 1982). AgriMet calculates reference evapotranspiration $\left(\mathrm{ET}_{0}\right)$ for a theoretical 12- to 20-inch-tall crop of alfalfa assuming full cover for the whole season. Evapotranspiration for each crop is calculated using ( $\mathrm{ET}_{0}$ ) and crop coefficients for each crop. These crop coefficients vary throughout the growing season based on the plant growth stage (crop cover). The crop coefficients are tied to the plant growth stage by three dates: start, full cover, and termination dates. Start dates are the beginning of vegetative growth in the spring for perennial crops or the emergence date for row crops. Full cover dates are typically when plants reach full foliage. Termination dates are defined by harvest, frost, or
dormancy. Alfalfa mean $\mathrm{ET}_{\mathrm{c}}$ is calculated for an alfalfa crop using $\mathrm{ET}_{0}$ and assuming a $15 \%$ reduction to account for cuttings.

Wind run is measured by the AgriMet weather station as total wind movement in miles over 24 hours at 9.8 ft above the ground. Weather data averages in the tables, except evapotranspiration, refer to the years preceding and up to, but not including, the current year.

## 2017 Weather

The total precipitation for 2017 (10.93 inches) was slightly higher than the 10-year and 74-year averages (10.09 inches) (Table 1). Precipitation for the months of January through April was higher than average.
Total snowfall for 2017 ( 31.5 inches) was higher than the 74-year average (17.7 inches) (Table 2). Contributing directly to the snow accumulation problems experienced over the winter of 2016-2017 were the higher than average snowfall and lower than average air temperature in December 2016 and January 2017. Snowfall in December 2016 was 19 inches and in January 2017 was 22 inches. From December 24, 2016 to February 15, 2017 there was a continuous minimum of 10 inches of snow on the ground. The highest snow depth of 28 inches occurred on January 19, 2017 and was the highest since records began in 1943. The average monthly maximum and minimum air temperatures for December of 2016 and January of 2017 were substantially lower than the 74-year average (Table 3). The lowest temperature for the year was $-22^{\circ} \mathrm{F}$ on January 7.
The highest air temperature for 2017 was $102^{\circ} \mathrm{F}$ on both July 23 and 24. The average maximum air temperature in July and August was higher than average. The average minimum air temperature in July and August was substantially higher than average.
The average monthly maximum and minimum 4-inch soil temperatures were close to the 19-year and 50-year averages (Table 4).
Total monthly wind runs in 2017 were close to the 24 -year average (Table 5). Total pan evaporation from May through October in 2017 was higher than the 69-year average (Table 6). Total accumulated reference evapotranspiration ( $\mathrm{ET}_{0}$ ) in 2017 was below the 25-year average (Table 7).
The year 2017 had 3337 growing degree-days ( 50 to $86^{\circ} \mathrm{F}$ ), close to the 25 -year average of 3300 (Table 8, Fig. 1). The year 2017 had a lower than average frost-free period (150 days) (Table 9). The last spring frost $\left(\leq 32^{\circ} \mathrm{F}\right)$ occurred on May 13,15 days later than the 41 -year-average date of April 28; the first fall frost occurred on October 10, 2 days later than the 41-year-average date of October 8. Snow depth was the only record broken in 2017 (Table 10).

## Acknowledgements

This work was supported by the National Oceanic and Atmospheric Administration, U.S. Bureau of Reclamation, Oregon State University, the Malheur County Education Service District and supported by Formula Grant nos. 2017-31100-06041 and 2017-31200-06041 from the USDA National Institute of Food and Agriculture.
